DETAILED ACTION

Claim Objections

Claims 45-100 are objected to because of the following informalities: there is no clear antecedent basis for "the generator". The independent claims recite "a generator", "an oscillatory air flow generator" and "a continuous air flow generator". Later the claims recite "the generator". It is not clear which of these three generators "the generator" is referring to.

Appropriate correction is required.

Claim Rejections - 35 USC § 103

Claims 78-89, 91-119 are rejected under 35 U.S.C. 103(a) as being unpatentable over Norton et al. in view of Hayek and McGrath 3,896,794. Norton teaches a generator figure 13 comprising an oscillatory air flow generator comprising an air chamber 10, a reciprocating piston 75 and first motor 76. A continuous air flow generator 79 is operably connected with the oscillatory air flow generator. Norton teaches a frequency-compensation feedback system, 83, 82. Norton appears silent with regard to whether the reciprocating piston 75 includes a diaphragm such is an obvious equivalent alternative. Hayek teaches the convention of the piston including a diaphragm in column 5 lines 12-16 "[s]aid piston member may be a flexible diaphragm secured around an edge region thereof to close a pump chamber and having a central region which is reciprocable to pump air to and from pump chamber". Norton also appears silent whether or not the pressurized source 79 is a continuous air flow generator. Such is usually the case. The system requires a continuous source of pressurized air for the oscillatory air flow generator to create pressure pulses. McGrath teaches an oscillatory air flow generator 12 and "the source 2 applies a continuous stream of gas under pressure to device 12" column 3, lines 9-10. It would have been obvious to one of ordinary skill in the art to modify Norton to use a

Application/Control Number: 10/055,849

Art Unit: 3764

diaphragm pump instead of the piston pump as taught by Hayek as an obvious equivalent type of piston pump and to use a continuous air flow generator as taught by McGrath for the specific type of source of air flow.

Claims 1-12 remain patentable. Claims 14-77 and 90 are allowable.

Response to Arguments

Applicant's arguments with respect to claims 78-89 and 91-119 have been considered but are most in view of the new ground(s) of rejection.

Applicant argues that the prior art doesn't teach the pressure-compensation feedback system to maintain a positive pressure at a predetermined value. It is not clear how much weight can be given these arguments since the claims rejected above do not require such limitation. These claims merely recite a generator maintains the positive pressure at a predetermined value. All of the prior art devices do that. All of the prior art that teaches a separate generator providing a positive air pressure source maintains the pressure at a positive predetermined value. This predetermined pressure value is irrespective of the repeated inhalation and expiration of the person. There is no sensor that detects the inhalation and expiration of the person and adjusts the air pressure accordingly.

Conclusion

Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, THIS ACTION IS MADE FINAL. See MPEP § 706.07(a).

While there is concurrent litigation related to this reissue application, action in this reissue application will NOT be stayed because there appears to be no significant overlapping issues between the application and that litigation. Due to the related litigation status of this
